

(a)

**Operator growth:**Late time most quantum system.

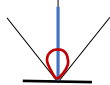

Teleports one qubit through state transfer mechanism. $\text{Sign}(g)$ independent. Infinite temperature.

(b)

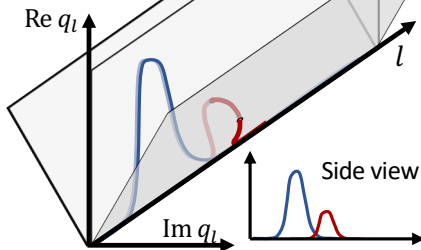

**Operator growth:**

Intermediate time. Chaotic spin chains, random circuits. Teleports many qubit through state transfer mechanism. $\text{Sign}(g)$ independent. Infinite temperature.

Back view

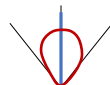

(c)

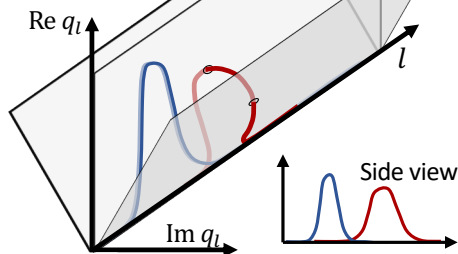

**Size winding (damped):**

Low temperature. Teleports through *state transfer* mechanism. Weak $\text{Sign}(g)$ dependence. Works weakly for “operator transfer”.

Back view

(d)

**Perfect size winding (not damped):**

Low temperature. Could teleport through *state transfer* mechanism. Strong $\text{Sign}(g)$ dependence, but limited fidelity. Works perfectly for “operator transfer” slightly before scrambling time. Strong signature of a ***geometrical wormhole***.
